Affordable - Custom Made Home Theater Ambient Light Projection Screens

A Locally developed Entertainment solution available ONLY through Invisible Stereo Dealers across the US and Abroad.

Representing a truly unique and affordable breakthrough in the ability to view Front Projection Imagery in both Dark as well as moderate Ambient Light conditions.

Black Flame Light Fusion utilizes the pigments whose properties are inherent in all electronically reproduced images, and combines them within a translucent base containing additional Silver and Pearlescent properties.

This allows the surface to present a more vivid, 3-Dimensional projected image than any Front Projection Screen has ever accomplished before. But in addition to doing so, it also works to reject nearly all Ambient light that exists within the viewing area, allowing the use of extremely large Screens in locations previously unable to accept them due to cost or practicality.

Totally customizable to virtually any viewing situation, Black Flame Light Fusion can even bring Big Screen entertainment out of the Dark at last. Ideal not only for Home Theater applications, but Family Rooms, Meeting Rooms, Churches and Exhibition Halls all now have a viable alternative to extremely expensive active electronic displays. No longer does one have to drastically dim the lights to obtain a dynamic image. The Eye-strain associated with viewing a bright image within a dark environment is now completely avoidable.

But perhaps the singularly most impressive aspect that Black Flame Light Fusion brings to the entertainment equation is affordability. Available in a Fixed screen format, or as a specialized Paint mixture, Black Flame Light Fusion can be custom made for hundreds of dollars less than any comparable Manufactured Screen. The paint and process is Patented, and currently is being sold Worldwide for many varied uses.

On the right is an “True Color Image” example of a 9 foot diagonal Black Flame Light Fusion Screen shown at the 2006 Vesta Home Show, its image being provided at that time by a 720p HD Projector. Together, the combined cost of such a magnificent display was less than the cost of “much smaller” 57’ - 62” HD Plasma or LCD displays. Please note the high degree of ambient light present, as well as the 3-Dimensionality present even in this digital photo!

This level of affordable performance is available EXCLUSIVELY to our Invisible Stereo Customers in every conceivable size and configuration.

- Call us for a REAL LIFE Demonstration! - Invisible Stereo 901-240-7999
These last two images show the creation of a 225” diagonal (16’ x 9’) S-I-L-V-E-R Screen, Spray painted onto a 1/4” thin Drywall surface on a Aluminum Frame. This Screen covers an existing window, but can be removed if Necessary. The Projector is a JVC RS-1 1080p ($3995.00) w/only 700 lumens available!

Remember this; Although they may say it cannot be done, at whatever cost, We or You can do it anyway...and for far less than any comparable Manufactured Screen
